

# **Cryptography and Network Security**

## **Chapter 12**

# Hash and MAC Algorithms

## ➤ Hash Functions

- condense arbitrary size message to fixed size
- by processing message in blocks
- through some compression function
- either custom or block cipher based

## ➤ Message Authentication Code (MAC)

- fixed sized authenticator for some message
- to provide authentication for message
- by using block cipher mode or hash function

# Hash Algorithm Structure

$IV$  = Initial value  
 $CV_i$  = chaining variable  
 $Y_i$  =  $i$ th input block  
 $f$  = compression algorithm

$L$  = number of input blocks  
 $n$  = length of hash code  
 $b$  = length of input block

# Secure Hash Algorithm

- SHA originally designed by NIST & NSA in 1993
- was revised in 1995 as SHA-1
- US standard for use with DSA signature scheme
  - standard is FIPS 180-1 1995, also Internet RFC3174
  - nb. the algorithm is SHA, the standard is SHS
- based on design of MD4 with key differences
- produces 160-bit hash values
- recent 2005 results on security of SHA-1 have raised concerns on its use in future applications

# Revised Secure Hash Standard

- NIST issued revision FIPS 180-2 in 2002
- adds 3 additional versions of SHA
  - SHA-256, SHA-384, SHA-512
- designed for compatibility with increased security provided by the AES cipher
- structure & detail is similar to SHA-1
- hence analysis should be similar
- but security levels are rather higher

# SHA-512 Overview

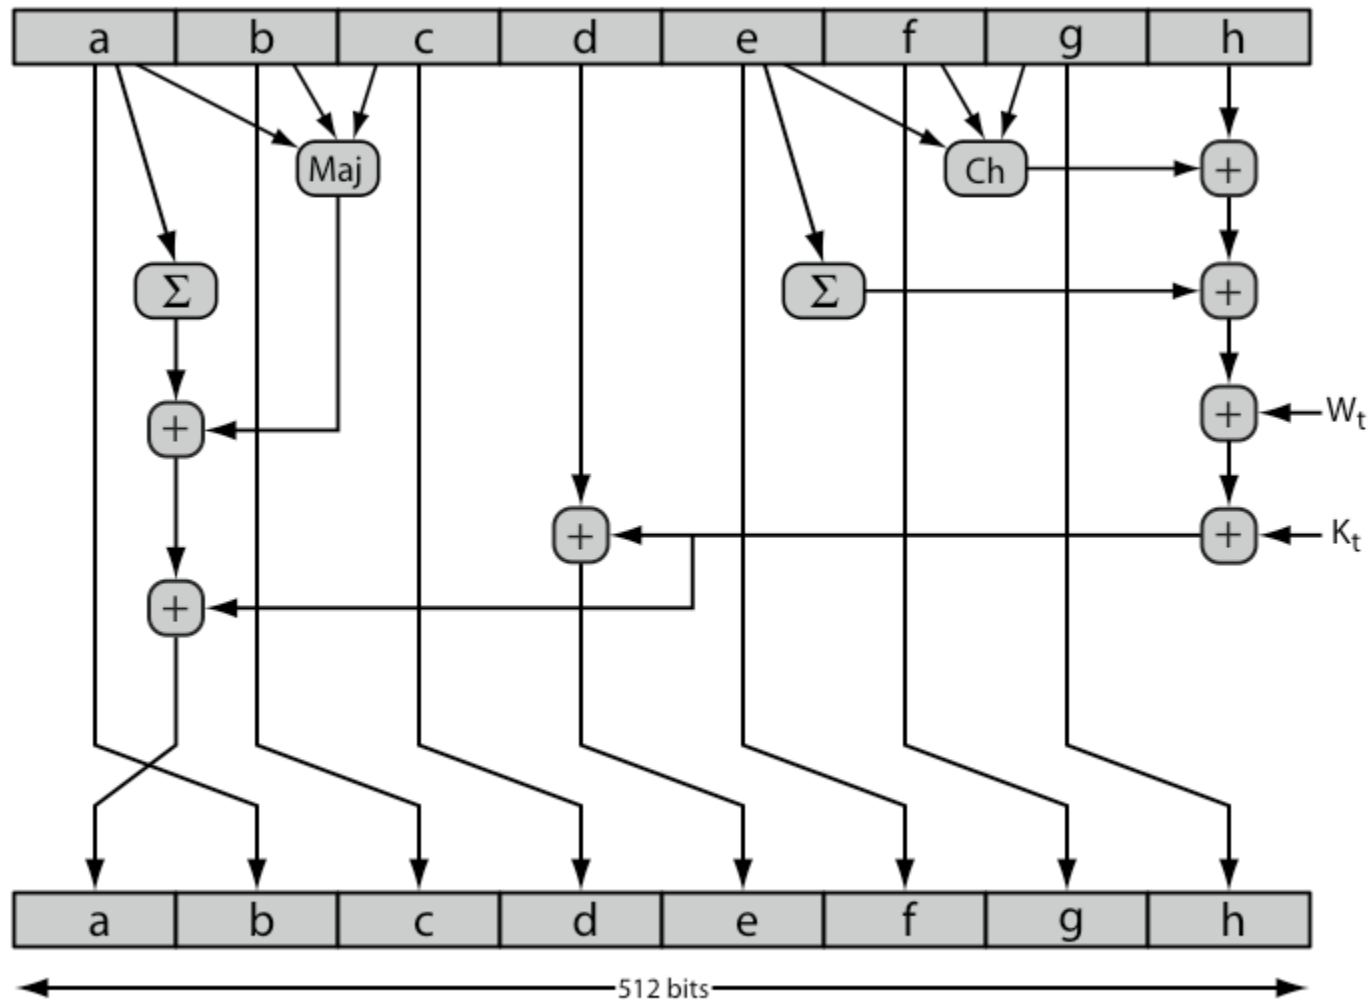

$+$  = word-by-word addition mod  $2^{64}$

# SHA-512 Compression Function

- heart of the algorithm
- processing message in 1024-bit blocks
- consists of 80 rounds
  - updating a 512-bit buffer
  - using a 64-bit value  $W_t$  derived from the current message block
  - and a round constant based on cube root of first 80 prime numbers

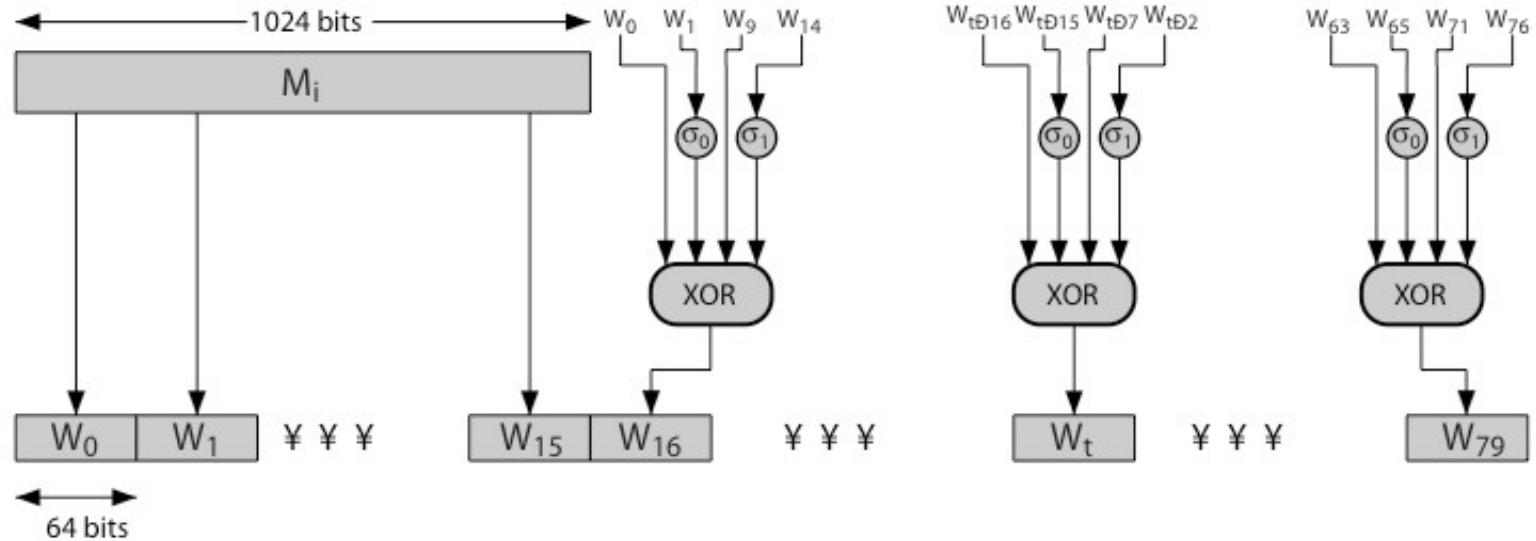

# SHA-512 Round Function

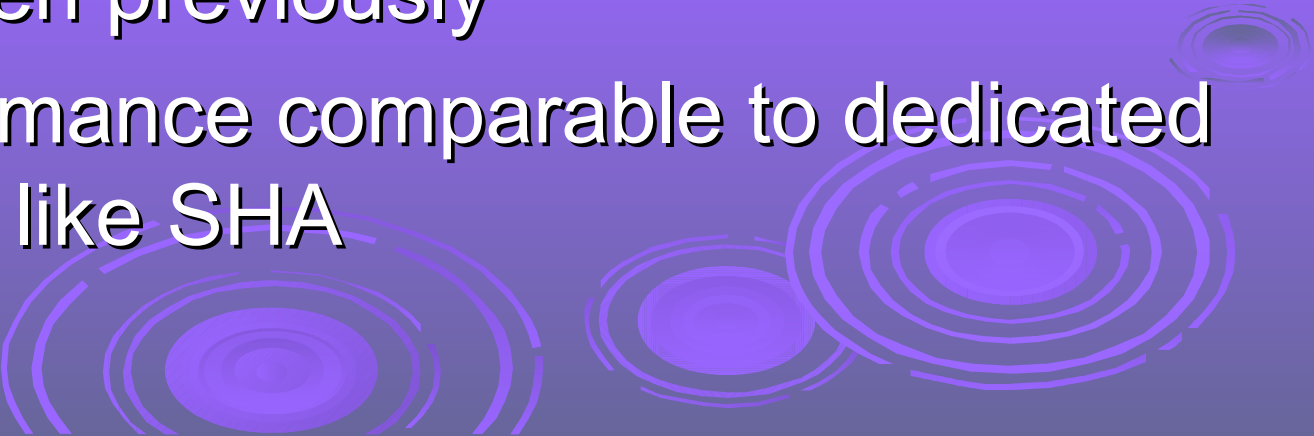

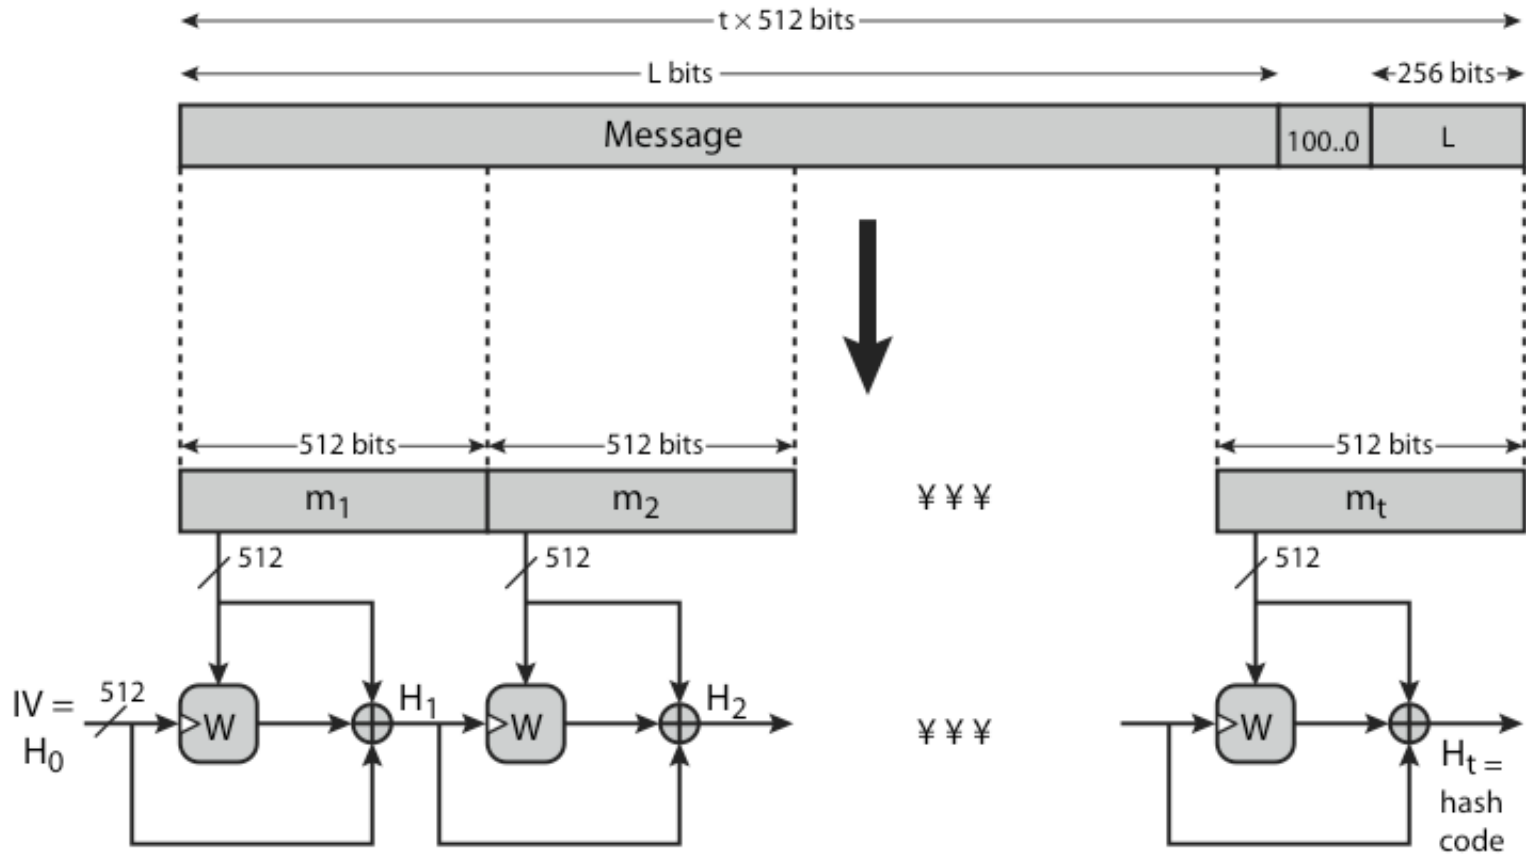

# SHA-512 Round Function

# Whirlpool

- now examine the Whirlpool hash function
  - endorsed by European NESSIE project
  - uses modified AES internals as compression function
  - addressing concerns on use of block ciphers seen previously
  - with performance comparable to dedicated algorithms like SHA
- 

# Whirlpool Overview

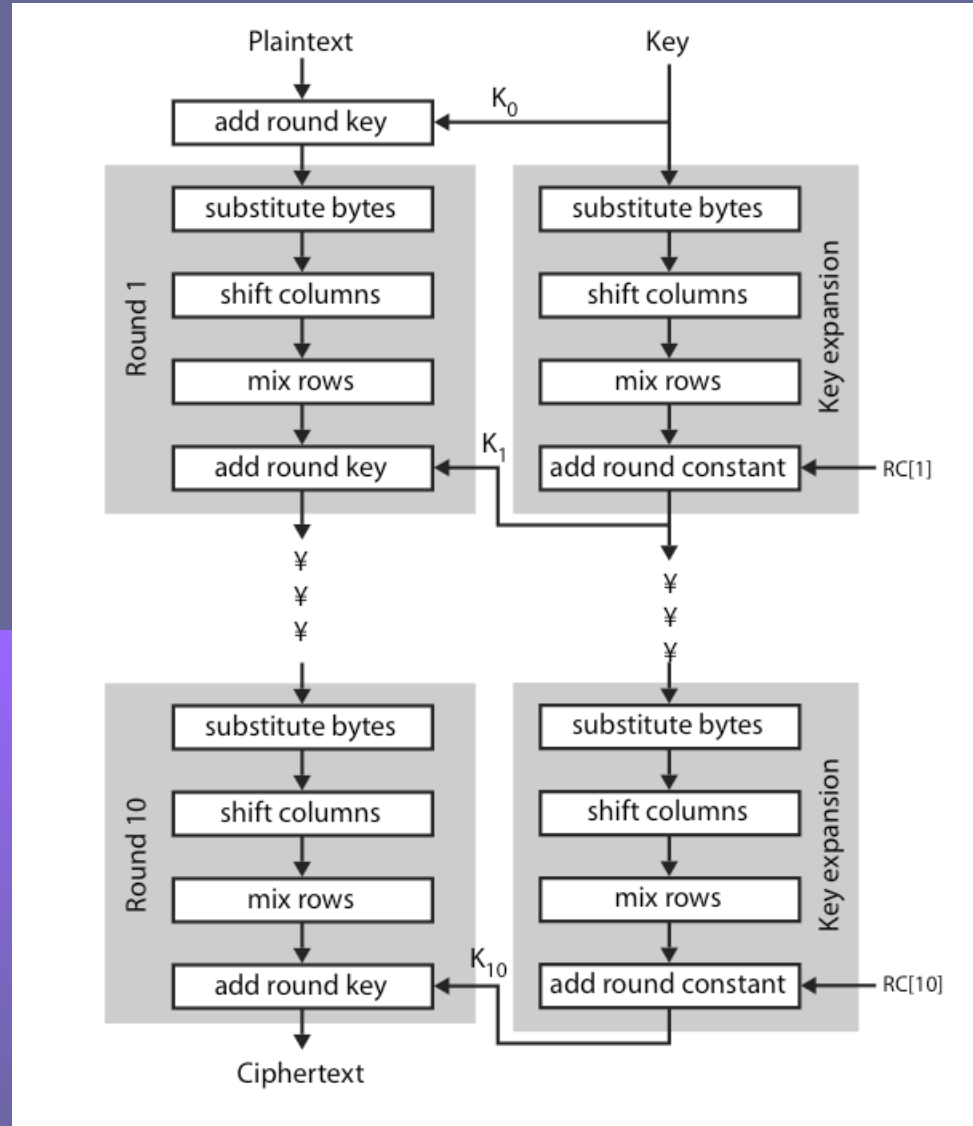

Note: triangular hatch marks key input

# Whirlpool Block Cipher W

- designed specifically for hash function use
- with security and efficiency of AES
- but with 512-bit block size and hence hash
- similar structure & functions as AES but
  - input is mapped row wise
  - has 10 rounds
  - a different primitive polynomial for  $GF(2^8)$
  - uses different S-box design & values

# Whirlpool Block Cipher W

# Whirlpool Performance & Security

- Whirlpool is a very new proposal
- hence little experience with use
- but many AES findings should apply
- does seem to need more h/w than SHA, but with better resulting performance

# Keyed Hash Functions as MACs

- want a MAC based on a hash function
  - because hash functions are generally faster
  - code for crypto hash functions widely available
- hash includes a key along with message

- original proposal:

$\text{KeyedHash} = \text{Hash}(\text{Key} | \text{Message})$

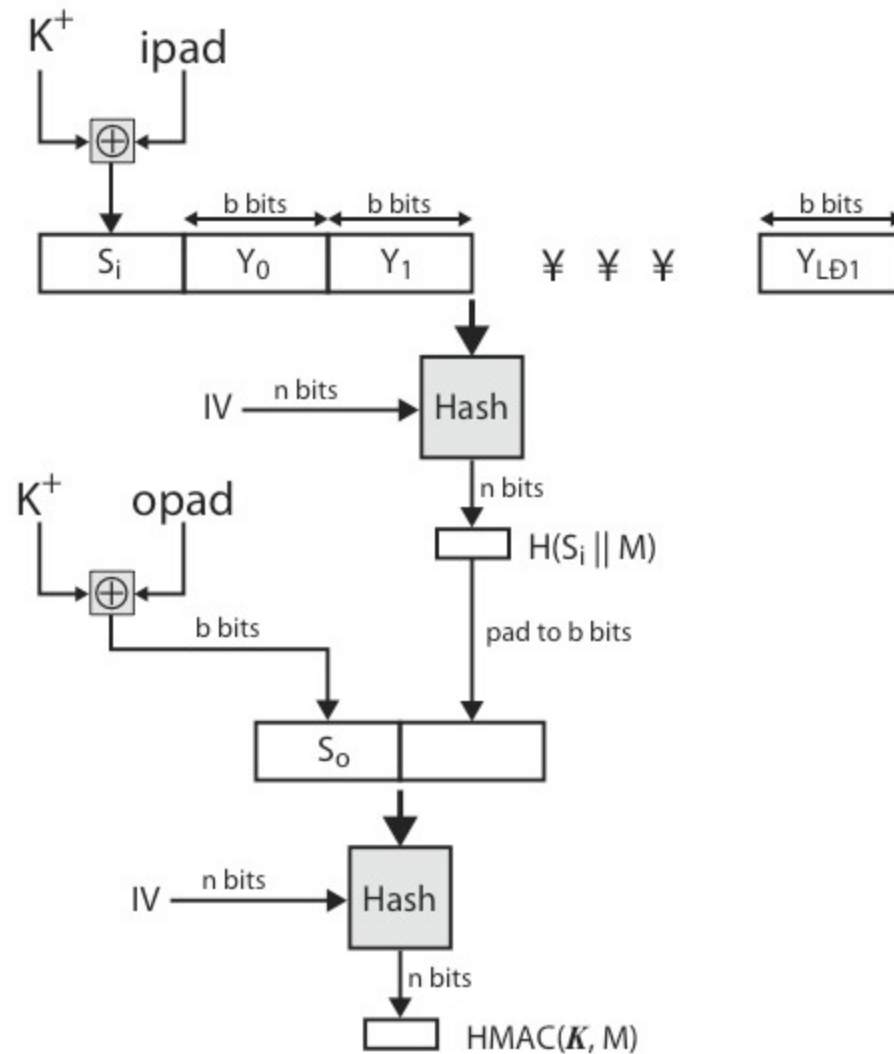

- some weaknesses were found with this
- eventually led to development of HMAC

# HMAC

- specified as Internet standard RFC2104
- uses hash function on the message:
$$\text{HMAC}_K = \text{Hash}[(K^+ \text{ XOR opad}) \parallel \text{Hash}[(K^+ \text{ XOR ipad}) \parallel M]]$$
- where  $K^+$  is the key padded out to size
- and opad, ipad are specified padding constants
- overhead is just 3 more hash calculations than the message needs alone
- any hash function can be used
  - eg. MD5, SHA-1, RIPEMD-160, Whirlpool

# HMAC Overview

# HMAC Security

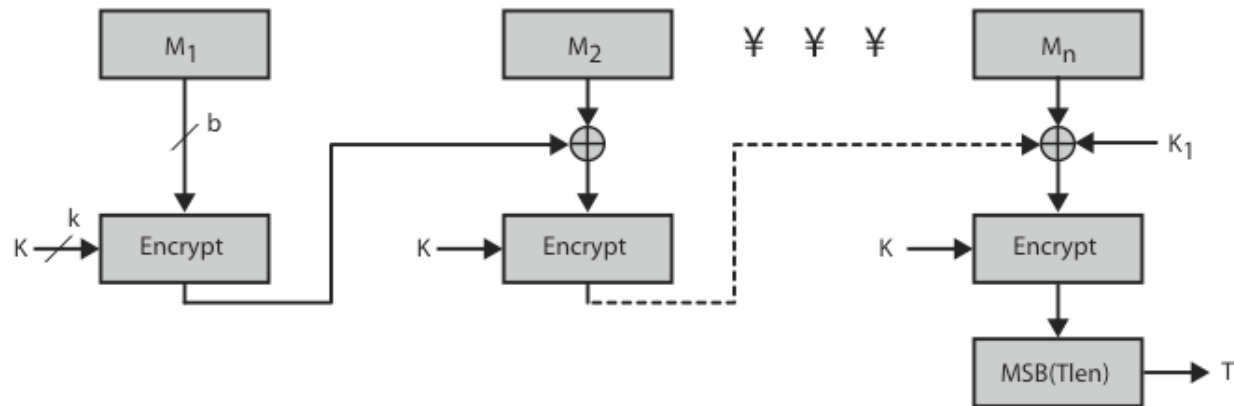

- proved security of HMAC relates to that of the underlying hash algorithm
- attacking HMAC requires either:
  - brute force attack on key used
  - birthday attack (but since keyed would need to observe a very large number of messages)
- choose hash function used based on speed verses security constraints

# CMAC

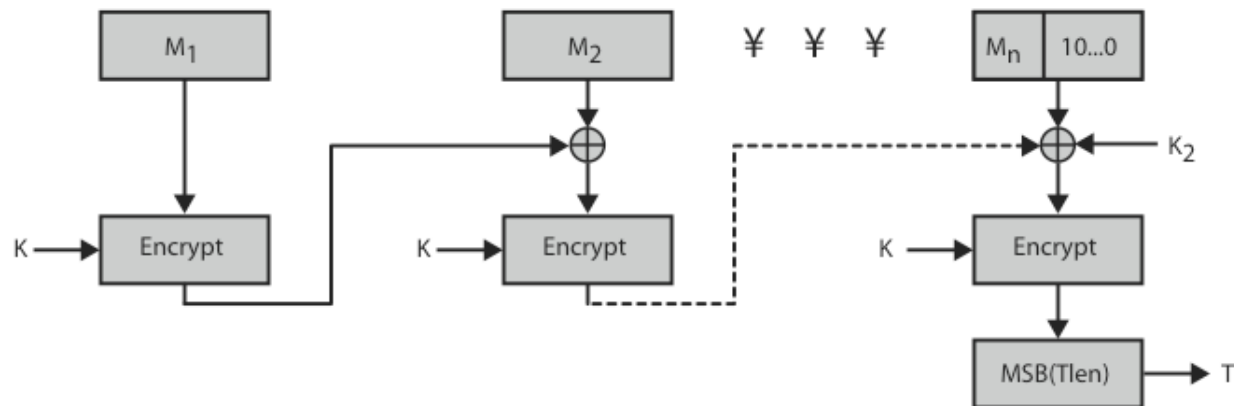

- previously saw the DAA (CBC-MAC)
- widely used in govt & industry
- but has message size limitation
- can overcome using 2 keys & padding
- thus forming the Cipher-based Message Authentication Code (CMAC)
- adopted by NIST SP800-38B

# CMAC Overview

(a) Message length is integer multiple of block size

(b) Message length is not integer multiple of block size

Figure 12.12 Cipher-Based Message Authentication Code (CMAC)

# Summary

## ➤ have considered:

- some current hash algorithms
  - SHA-512 & Whirlpool
- HMAC authentication using hash function
- CMAC authentication using a block cipher
